Abstract— The thesis is a requirement for graduation from Bumigora university. The final year student's problem is determining the research topic because the undergraduate thesis collection of Computer Science is not grouped or classified based on student competencies. The purpose of this study was to compare the performance of the naïve Bayes method with TF-IDF weighting and without TF-IDF weighting for the classification of thesis topics based on the abstract. The stages of this research are data collection, text pre-processing, term weighting with TF-IDF and without TF-IDF, Naïve Bayes method implementation, and result evaluation. Based on the results of the tests that have been done, the naïve Bayes method with TF-IDF has an accuracy of 81.74%, a precision of 86.1%, and a sensitivity of 80.15%. While the naïve Bayes method without TF-IDF weighting produces 88.69% accuracy, 89.76% precision, and 90.49% sensitivity. Thus, the naïve Bayes method without TF-IDF weighting has better performance than TF-IDF weighting for the classification of thesis topics based on the abstract.

Keywords—naïve bayes, TF-IDF weighting, abstract classification

I. INTRODUCTION

The thesis is one of the graduation requirements for undergraduate Computer Science students at Bumigora University. Students can start working on their thesis if the research topic has been approved through a synopsis exam. So far, students have difficulties in determining the proposed thesis topic. One of the difficulties is because the existing collection of an undergraduate thesis in Computer Science is not grouped or classified based on student competencies. Automatic thesis grouping or classification of topics is one solution that can make it easier for students to find references to research titles based on their competence. The competencies of students in the S1 Computer Science program at Bumigora university are computer networks, multimedia, and software engineering (RPL).

One of the solutions offered by this paper is to use the concept of text mining. Previous research used various methods for text mining-based thesis document analysis such as the k-means method [1]–[4], K-Nearest Neighbor [5]–[7], Cosine Similarity [8], [9], Decision Tree and Naïve Bayes [10], SVM and Naïve Bayes [11]. Research [10] compared Decision Trees, Naïve Bayes, and k-NN methods to predict thesis graduation. Based on the results of his research, the k-NN method has the best accuracy compared to the decision tree and naïve Bayes methods at 80.39%. Research [4] used

the k-means method for grouping thesis titles. Before grouping, the first weighting of words is carried out using the TF-IDF method. Research [9] uses the cosine similarity method for the classification of thesis documents. Before grouping, the first weighting of words is carried out using the TF-IDF method.

Based on previous research, there is a difference made with this research, namely the research carried out a classification of thesis topics based on the abstract using the naïve Bayes method and also using the k-fold cross-validation test method. The aim is to compare the performance of the naïve Bayes method with TF-IDF weighting and without TF-IDF weighting for the classification of thesis topics based on the abstract. The performance used in this study is accuracy, precision, and sensitivity.

II. RESEARCH METHOD

The stages used in this study are shown in Figure 1.

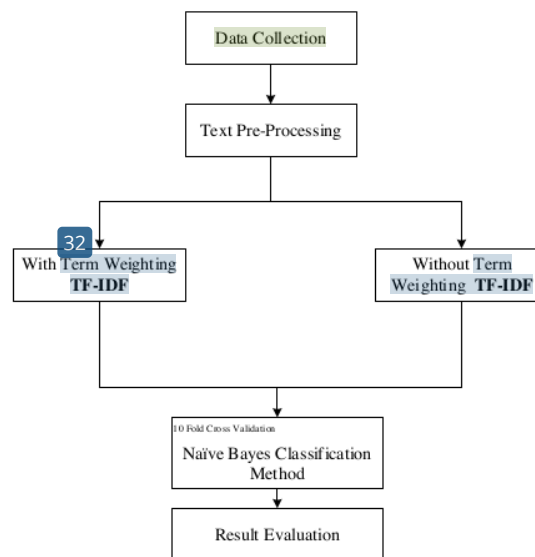

Figure 1. Research Methodology

A. Data Collection

The data used in this study are the thesis abstracts of 2020 graduate computer science undergraduate students obtained

from www.repository.universitاسbumigora.ac.id. The data collected were 115 thesis abstract data, consisting of 36 topics of computer networks, 23 multimedia, and 55 software engineering (RPL).

B. Text Pre-Processing

Text pre-processing used to get quality data. The classification was carried out using the naïve Bayes method. The text pre-processing technique used in this study consists of case folding, tokenization, stop word removal, and stemming [12]. Case folding is used to change text to lowercase. Tokenization is used to separate text into tokens. Stopword removal is used to remove unnecessary words such as conjunctions. Stemming is used to change all words that have affixes into basic words.

C. Term Weighting TF-IDF

The term weighting process is used to give a weight value to each word. The term weighting method used in this study is the Term Frequency - Inverse Document Frequency (TF-IDF). The TF-IDF method combines two concepts, namely TF and IDF. TF looks for the occurrence value of terms in related documents, the more occurrences of terms in the related document, the better. Meanwhile, the IDF concept is inversely proportional to the TF method, the less frequently the terms appear in all documents the better. TF - IDF method is calculated using equation (1) [13].

$$W_{ij} = tf_{ij} \times idf_j = tf_{ij} \times \log \left(\frac{N}{df_j} \right) \quad (1)$$

W_{ij} is the weight of term j to document i . tf_{ij} is the number of occurrences of term j in the document d . N is the number of documents, and df_j is the number of occurrences of term j throughout the document.

D. Naïve Bayes Method Classification

At this stage, the classification is carried out using the naïve Bayes method. The basic concept of the naïve Bayes method is a probability-based classification method that assumes independence from the dependent variable and is also a conditional model based on the Bayes theorem [14][15]. The Naïve Bayes method which is calculated based on equation (2).

$$P(c | \text{term document } d) = P(c) \times P(t_1|c) \times P(t_2|c) \times P(t_n|c) \quad (2)$$

$P(c)$ is the prior probability of class c . $P(c | \text{term document } d)$ is the probability of the appearance of a term in document d including class c . $P(t_n | c)$ is the probability of occurrence of term n known to class c .

The process of calculating the prior probability for class c uses equation (3).

$$P(c) = \frac{N_c}{N} \quad (3)$$

N_c is the number of class c in all documents, while N is the total number of documents. The calculation of the probability of occurrence of term n is calculated using equation (4) involving the laplacian technique.

$$P(t_n | c) = \frac{\text{count}(t_n, c) + 1}{\text{count}(c) + |V|} \quad (4)$$

$\text{count}(t_n, c)$ is the number of terms t_n appearing in the training data with class c . $\text{count}(c)$ is the number of terms in the class training data c . w_{ij} is used to give weight to the value of each word. V is the number of terms in the training data.

Data classified by multinomial naïve Bayes method are grouped into training and testing data first. The distribution of training and testing data in this study uses the k-fold cross-validation method by dividing the data as much as the specified k . Each fold can be used as training and testing data in turn. This research uses 10 fold data validation method.

E. Result Evaluation

At this stage, the results are evaluated based on accuracy, precision, and sensitivity using the confusion matrix table shown in Table I.

TABLE I. CONFUSION MATRIX

Actual	Predicted	
	Positive	Negative
Positive	True Positive (TP)	False Negative (FN)
Negative	False Positive (FP)	True Negative (TN)

Evaluation of results based on accuracy, precision, and sensitivity using equations (5), (6), and (7).

$$\text{Accuracy} = \frac{TP+TN}{TP+FN+TN+FP} \quad (5)$$

$$\text{Precision} = \frac{TP}{TP+FP} \quad (6)$$

$$\text{Sensitivity} = \frac{TP}{TP+FN} \quad (7)$$

III. RESULT AND DISCUSSION

A. Data Collection

The data used in this study are the thesis abstracts of 2020 graduate computer science undergraduate students obtained from www.repository.universitاسbumigora.ac.id. The data collected were 115 thesis abstract data, consisting of 36 topics of computer networks, 23 multimedia, and 55 software engineering (RPL). The sample abstract data of this research thesis is shown in Table II.

TABLE II. THESIS ABSTRACT DATASET

No	Abstract	Topic
1.	Perkembangan teknologi informasi sangat cepat seperti Internet of Things (IoT), dimana seseorang dapat melakukan segala aktivitasnya dengan mudah dengan mengandalkan sistem Internet of Things (IoT). Seiring dengan perkembangan zaman maka semakin canggih teknologi yang dihasilkan baik digunakan sebagai hal yang positif maupun melakukan hal yang negatif, tak terkecuali pada sistem peternakan sehingga perlu mengembangkan teknologi untuk manajemen pakan ternak khususnya hewan ternak ayam broiler. Pengembangan sistem menggunakan sistem Internet of Things dan sistem penjadwalan otomatis dimana sistem Internet of Things (IoT) adalah sistem yang berfungsi melakukan controller pada alat elektronik. Metodologi	Jaringan

No	Abstract	Topic
27	penelitian yang digunakan adalah Network Development Life Cycle (NDLC), terdiri 29 analisis, desain, prototype dan ujicoba. Pada tahap analisis memuat tentang pengumpulan data, tahap desain memuat rancangan sistem pemberian pakan ternak, prototyping memuat instalasi konfigurasi dan membangun kerangka sistem pakan ternak. Ujicoba memuat tentang pengujian sistem pemberian pakan ternak secara otomatis atau terjadwal. Kesimpulan dari penelitian ini adalah mengimplementasi Sever VPS dengan sistem nodecmu dalam pemberian pakan ternak berbasis Internet of Things (IoT) untuk efisiensi dalam pemberian pakan ternak ayam.	

B. Text Pre-Processing

Text pre-processing used to get quality data. The classification was carried out using the naïve Bayes method. The text pre-processing technique used in this study consists of case folding, tokenization, stop word removal, and stemming. The examples of text pre-processing stages are shown in Table III.

TABLE III. EXAMPLE OF TEXT PREPROCESSING

Pre-processing	Result
Data Original	Tujuan pembuatan sistem pakar diagnosis jenis penyakit THT adalah memudahkan masyarakat umum untuk mengetahui jenis penyakit THT diderita tanpa perlu datang ke dokter spesialis THT
Case Folding	tujuan pembuatan sistem pakar diagnosis jenis penyakit tht adalah memudahkan masyarakat umum untuk mengetahui jenis penyakit tht diderita tanpa perlu datang ke dokter spesialis tht
Tokenization	['tujuan', 'pembuatan', 'sistem', 'pakar', 'diagnosis', 'jenis', 'penyakit', 'tht', 'adalah', 'memudahkan', 'masyarakat', 'umum', 'untuk', 'mengetahui', 'jenis', 'penyakit', 'tht', 'diderita', 'tanpa', 'perlu', 'datang', 'ke', 'dokter', 'spesialis', 'tht']
stop word removal	['sistem', 'pakar', 'diagnosis', 'jenis', 'penyakit', 'tht', 'masyarakat', 'mengetahui', 'jenis', 'penyakit', 'tht', 'diderita', 'dokter', 'spesialis', 'tht']
stemming	['sistem', 'pakar', 'diagnosis', 'jenis', 'sakit', 'tht', 'masyarakat', 'tahu', 'jenis', 'sakit', 'tht', 'diderita', 'dokter', 'spesialis', 'tht']

C. Term Weighting TF-IDF

The term weighting process is used to give weight to the value of each word. The term or word weighting method used in this study is TF-IDF. The example of the TF-IDF calculation process using the documents in Tabel III, the stemming section, is shown in Table IV.

TABLE IV. RESULT OF WEIGHTING TERM TF-IDF

Term	tf				log (IDF)+1	W= tf * (IDF+1)
	D1	D	D/df	D		
datang	1	1	1	1	1	1
derita	1	1	1	1	1	1
diagnosis	1	1	1	1	1	1
dokter	1	1	1	1	1	1
jenis	2	1	1	1	1	2
masyarakat	1	1	1	1	1	1

pakar	1	1	1	1	1
sakit	2	1	1	1	2
sistem	1	1	1	1	1
spesialis	1	1	1	1	1
tht	3	1	1	1	3

D. Naïve Bayes Method Classification

At this stage, the classification is carried out using the naïve Bayes method by comparing the performance using TF-IDF weighting and without TF-IDF weighting using equation (2).

E. Result Evaluation

At this stage, results are evaluated based on accuracy, precision, and sensitivity using the confusion matrix table shown in Table V, VI, and VII.

TABLE V. CONFUSION MATRIX OF NAÏVE BAYES WITH TF - IDF

Actual	Predicted			Sensitivity
	Jaringan	Multimedia	RPL	
Jaringan	31	0	6	83.78%
Multimedia	0	18	9	66.67%
RPL	4	1	45	90%
Precision	88.57%	94.74%	75%	

TABLE VI. CONFUSION MATRIX OF NAÏVE BAYES WITHOUT TF - IDF

Actual	Predicted			Sensitivity
	Jaringan	Multimedia	RPL	
Jaringan	33	0	4	89.19%
Multimedia	0	26	1	96.29%
RPL	5	2	43	86%
Precision	86.84%	92.86%	89.58%	

TABLE VII. PERFORMANCE RESULT OF NAÏVE BAYES METHOD

Performance	With TF - IDF	Without TF - IDF
Accuracy	81.74%	88.69%
Precision	86.1%	89.76%
Sensitivity	80.15%	90.49%

Based on the results of the tests shown in Table VII, the naïve Bayes method with TF-IDF has an accuracy of 81.74%, a precision of 86.1%, and a sensitivity of 80.15%. While the naïve Bayes method without TF-IDF weighting produces **88.69%** accuracy, **89.76%** precision, and **90.49%** sensitivity. Thus, the naïve Bayes method without TF-IDF weighting has better performance than TF-IDF weighting for the classification of thesis topics based on the abstract.

IV. CONCLUSION

Based on the results of the tests that have been done, the naïve Bayes method with TF-IDF has an accuracy of 81.74%,

a precision of 86.1%, and a sensitivity of 80.15%. While the naïve Bayes method without TF-IDF weighting produces **88.69%** accuracy, **89.76%** precision, and **90.49%** sensitivity. Thus, the naïve Bayes method without TF-IDF weighting has better performance than TF-IDF weighting for the classification of thesis topics based on the abstract. The suggestions for further research can use feature selection methods such as chi-square to improve the performance of the naïve Bayes method.
